

# CSE308

## Requirements

### Session Objectives

- Learn how to determine what to build
  - Requirements elicitation
  - Requirements analysis
  - Rapid prototyping
- Review techniques for requirements elicitation and requirements analysis
- Learn how to describe the system you are going to build
  - CASE tools
  - Prototypes

### Project Teams

- Send an e-mail with your improved team name
- For now the names (and team members) are:

Need confirmation  
from:

1. Lawrence Chong
2. Liwen Fan
3. Samuel McKay

Team	Group
Aditya Balwani, Michelle Chan, Halaa Menasy, and Purav Shah	Aspen
Zhi Cao, Jintian Chen, Yongbin Chen, and Zewei Zhang	Birch
Brian Lee, Yiu Chau Lin, Yi Xie, and Yue Zhao	Cedar
Andrew Allhusen, Nolan Donoghue, Bridger Hahn, and Anthony Ria	Dogwood
Thomas Bundy, David Kang, Angelo Rizzuto, and Daniel Sha	Elm
Brandon Fieger, Paul Mannarino, Kevin Setayesh, and Kevin Young	Fir
Duan Hang Chen, Lawrence Chong, Hanyun Feng, and Marvin Yan	Ginkgo
Liwen Fan, Yinquan Hao, and Wenyan Lei	Hemlock
Refath Hossan, Samuel McKay, William Murdy, and Joseph Sanossian	Ilex

### Project Deliverables

- Your project will be developed in various stages
- Each stage will include one or more deliverables (e.g., documents, partial code, design diagrams)
- You will submit these items through a shared repository or your choice
- More details on the submission process and the repository once the TA has been assigned to the course

## Overall Project Schedule

- Detailed schedule in class Web site
- Major milestones
  - 2/18-3/7 - Requirements documents
  - 3/11-3/25 - Design document
  - 3/21-3/23 - Design reviews
  - 3/28 - Final design document
  - 4/11-4/18 - Code reviews
  - 4/15-5/3 - Final demonstrations
  - 4/25-5/4 - Final demo

You will be  
developing your  
design (and  
some code)  
while you work  
on requirements

## MIS Requirements Deliverables

- February 22
  - List of user roles
  - List of use cases
  - 5 complete use cases (text form)
  - Preliminary issues document
- March 1
  - Sample page look and feel
  - Prototype GUI for admins/downloads (if needed)
- March 5
  - Working user interface (html only)
- March 9
  - Final requirements document (including all use cases)

Requirements phase of  
your project is more  
straightforward than a  
typical IT project

## MIS Requirements Document

- Title
  - Related documents
  - Project Overview (1-2 pages) - text summary of project
  - Performance
  - System
  - Use cases
  - GUI
    - Look and feel
    - Working prototype
- The requirements document will become more complete and accurate as you learn more about the system
- The working GUI prototype and the use cases are (by far) the most important part of this document

## What are Requirements?

"You can't always get what you want  
You can't always get what you want  
But if you try sometimes well you might find  
You get what you need"

Rolling Stones

- Sometimes (frequently?), your client will have a difficult time in stating the requirements
  - Limited understanding of real issues
  - Inability to comprehend the scope of a new system
  - Inconsistent views of system

## Requirements Engineering ...

- Inception—ask a set of questions that establish ...
  - basic understanding of the problem
  - the people who want a solution
  - the nature of the solution that is desired, and

People usually think in terms of what they are doing now, not how to improve it
- Elicitation—elicit requirements from all stakeholders
- Elaboration—create an analysis model that identifies data, function and behavioral requirements  

What are some data and behaviors of the project?
- Negotiation—agree on a deliverable system that is realistic for developers and customers (cost, performance, etc.)  

Many times in Agile development, the customer works with the developers

## ... Requirements Engineering

- Specification—can be any one (or more) of the following:
  - A written document
  - A set of models
  - A formal mathematical model
  - A collection of user scenarios (use-cases)
  - A prototype

Your team should begin to prepare for an in-class requirements review - possibly Wednesday
- Validation—a review mechanism that looks for
  - errors in content or interpretation
  - areas where clarification may be required
  - missing information
  - inconsistencies (a major problem when large products or systems are engineered)
  - conflicting or unrealistic (unachievable) requirements.
- Requirements management (tools to trace requirements)  

For very large systems

## Requirements Analysis Techniques

- Interviewing
  - Structured versus unstructured interviews
- Questionnaires
  - Need to understand the application domain
- Forms analysis
  - Conduct team meetings
- Focus groups (e.g., video capture)
  - Frequently, the requirements analysis will be performed by analysts, not necessarily computer scientists
- Scenarios (e.g., story boards)
- Rapid prototyping

Know your limitations!

## Discussion

- Volunteer team to articulate the requirements for
  - The project admin sub-system
  - The download sub-systems

What are the roles in the project?

© Robert Kelly, R. Pressman, and S. Schach, 2005-2016

### Categories of Requirements

- **Functional** - specifies an action that the system must be able to perform
  - Sometimes specified as inputs and outputs
- **Nonfunctional**
  - Platform constraints
  - Performance (e.g., response time, availability)

© Robert Kelly, R. Pressman, and S. Schach, 2005-2016

### Look and Feel

- Your project should have a consistent style within a role
- For Web GUI, you can use a design template
- HTML design tools available

Bootstrap is very helpful in quickly building a good GUI

© Robert Kelly, R. Pressman, and S. Schach, 2005-2016

## Prototypes

- Excellent technique to elicit requirements from users
  - Users interact with the system, although none of the business logic (e.g., DB access) is operational
  - Consists of
    - Project components (e.g., role views)
    - Look and feel
    - Interaction style
    - Access to data and results (simulated)
- Decouple object access from DB access*
- You may need to fake an Ajax interaction with some JavaScript*

© Robert Kelly, R. Pressman, and S. Schach, 2005-2016

## Rapid Prototyping

- Advantages
  - Speed
  - No ambiguities, omissions, contradictions
- Disadvantages
  - Specification document is contract
  - Testing requires specifications
  - Maintenance requires specifications

© Robert Kelly, R. Pressman, and S. Schach, 2005-2016

## Human Factors

- Client and intended users must interact with the user interface
  - Human-computer interface (HCI)
  - Human factors must be taken into account
    - Expertise level of interface
    - Consistency of interface style
    - Uniformity of appearance
  - Rapid prototype of HCI advisable
- Be sure to select users typical of each role

© Robert Kelly, R. Pressman, and S. Schach, 2005-2016

## Reusing the Rapid Prototype

- Options
    - Extend the prototype - usually feasible with a Web interface
    - Discard the prototype
    - Reuse some of the prototype
  - Use of different language or rapid prototype tool
- Use of MVC is a huge advantage

© Robert Kelly, R. Pressman, and S. Schach, 2005-2016

## Have You Satisfied the Objectives?

- Learn how to determine what to build
  - Requirements elicitation
  - Requirements analysis
  - Rapid prototyping
- Review techniques for requirements elicitation and requirements analysis
- Learn how to describe the system you are going to build
  - Prototypes
